Cloudbeds — Data Services Analyst, Latin America

Dear Hiring Team,

I am applying for the Data Services Analyst role as someone who already uses **Cloudbeds every working day**. At Ultra Infinity Hotel I handle reservations, rate plans, availability and property configuration in it, and I keep rates and inventory consistent between the booking engine and our OTA channels.

Before this I spent a year on the front desk of a beachfront resort as night auditor, reconciling the day's transactions, revenue and payment methods across front desk and restaurant before closing the system. That is where I learned what a property's data actually means: which discrepancies matter, which are noise, and what breaks downstream when a rate or a folio is wrong. When a migration goes sideways, I will know what the hotelier is looking at.

Both halves of this role are work I already do. I am the founder and lead developer of AsistoYA, a multi-tenant SaaS in production used by schools. **I onboard every new client myself**: I take the spreadsheets they already keep, clean and map their student, staff and course records, validate them against what the client expects to see, and then train their team on the reports. I also handle their first-line support, so I am used to explaining a technical problem to someone who is mid-crisis and not technical.

I recently completed a **300-hour database diploma** at ITLA, and I built a night-audit web application that digitized the reconciliation I had been doing by hand — the clearest proof I can offer that I turn operational pain into working software. AsistoYA took 3rd place nationally at the MESCyT 2025 competition and raised RD\$400,000 in seed capital.

I am a native Spanish speaker with professional working English (Duolingo English Test: 115), based in the Dominican Republic, and set up for remote work.

I would welcome the chance to talk about how I can help your clients get their data into Cloudbeds cleanly.

Sincerely,

Enmanuel Reynoso Salazar
